

Expose your cyber security weaknesses, understand where you are at risk and see the path forward.

nowSecure Assess is a thorough, comprehensive review of your security infrastructure that leaves no stone unturned. This assessment, led by our experienced cybersecurity experts, helps you to determine what technologies and security controls are operating effectively.

At Nowcomm, we don't approach cyber security as just a technical issue, our methodology revolves around three key elements of information security: **people, process and technology**.

nowSecure Assess is delivered in 3 key stages completed within 6 to 9 days:

✓ RISK ASSESSMENT

A security risk assessment is conducted to baseline the organisation against the National Institute of Standards and Technology, Cybersecurity Framework (NIST CSF), considered to be an industry best practice. The report will detail how your business aligns to the standard as well as benchmarking you against other organisations in relation to size, location and industries.

✓ TECHNICAL REVIEW

The technical assessment drills down into the detail of the security gaps in terms of internal and external vulnerabilities as well as examining your layers of security solutions and how effective they are in protecting your organisation.

✓ ASSESSMENT REPORT

A full assessment report of your overall cyber security status will include:

- Your security strengths and weaknesses.
- Recommendations on how to improve your security posture.
- High level plan of actions and priorities.

Improve cyber resilience with nowSecure Assess.

Receive a comprehensive assessment with a cyber-security expert, based on industry best practice (NIST CSF).

Identify and fix vulnerabilities that can potentially be exploited by attackers with non-disruptive external vulnerability scans on all externally accessible systems protected by your firewalls.

Protect and tighten systems and application security with vulnerability testing from the inside of the network.

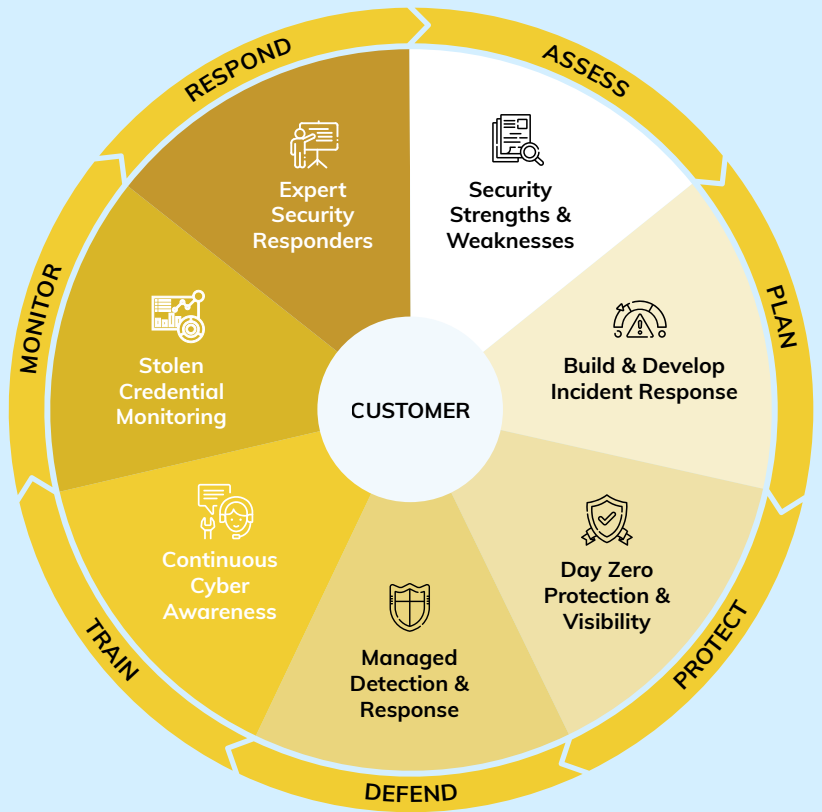

Protect hybrid workers with evaluation of the layers of endpoint security, general use of threat intelligence and cloud-based / on-premise protection technologies.

Quickly determine strengths as well as opportunities for improvement with an easy to understand and actionable report.

Your existing environment will be marked using a traffic light system so you can prioritise the most pressing actions first.
